

Solutions to Practice Test B for Midterm Exam 3

1. (10 points) Find a function $f(x)$ such that $f(1) = 3$, $f'(1) = 5$, and $f''(x) = 12x^2 + 12x$.

Solution. Antidifferentiating $f''(x) = 12x^2 + 12x$ gives $f'(x) = 4x^3 + 6x^2 + C$, for some constant C .

But $5 = f'(1) = 4 + 6 + C$, and hence $C = -5$.

That is, $f'(x) = 4x^3 + 6x^2 - 5$.

Antidifferentiating again, $f(x) = x^4 + 2x^3 - 5x + K$, for some constant K .

But $3 = f(1) = 1 + 2 - 5 + K$, and hence $K = 5$. Thus, $f(x) = x^4 + 2x^3 - 5x + 5$

2. (25 points) Let $f(x) = \frac{2x^3 + 45x^2 + 315x + 600}{x^3}$. Take my word for it that

$$f'(x) = \frac{-45(x+4)(x+10)}{x^4}, \quad \text{and} \quad f''(x) = \frac{90(x+5)(x+16)}{x^5}.$$

Sketch the graph of $y = f(x)$, clearly indicating **horizontal and vertical asymptotes**, **local extrema**, **inflection points**, and **intervals of increase and decrease and of concavity**.

You do **not** need to indicate locations of intercepts or y -coordinates of extrema or inflection points.

Solution. The vertical asymptotes occur when we divide by zero, i.e., at $x = 0$ [f is defined and continuous everywhere else.]

For the horizontal asymptotes, we compute

$$\lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} 2 + \frac{45}{x} + \frac{315}{x^2} + \frac{600}{x^3} = 2, \quad \text{and} \quad \lim_{x \rightarrow -\infty} f(x) = \lim_{x \rightarrow -\infty} 2 + \frac{45}{x} + \frac{315}{x^2} + \frac{600}{x^3} = 2.$$

So $y = 2$ is a horizontal asymptote on both sides

Meanwhile, f' is defined everywhere except at the vertical asymptote $x = 0$. Moreover, $f'(x) = 0$ exactly at $x = -4$ and $x = -10$, so these are the only critical points. Our f' chart is:

x	$(-\infty, -10)$	$(-10, -4)$	$(-4, 0)$	$(0, \infty)$
$f'(x)$	-	+	-	-
$f(x)$	↘	↗	↘	↘

There is a local minimum at $x = -10$ and a local maximum at $x = -4$

Turning to the second derivative, we see that f'' is also defined everywhere except the asymptote $x = 0$; it is zero exactly at $x = -16$ and $x = -5$. The f'' chart is:

x	$(-\infty, -16)$	$(-16, -5)$	$(-5, 0)$	$(0, \infty)$
$f''(x)$	-	+	-	+
$f(x)$	∩	∪	∩	∪

There are inflection points at $x = -16$ and $x = -5$ (Note that $x = 0$ is an asymptote, not an inflection point.)

See separate PDF for a sketch of the graph.

3. (15 points) Let $g(x) = 4x^5 - 5x^4 - 40x^3$. Find all critical points of g in $(-\infty, \infty)$, and classify each as a local maximum, local minimum, or neither.

Solution. We compute $g'(x) = 20x^4 - 20x^3 - 120x^2 = 20x^2(x^2 - x - 6) = 20x^2(x - 3)(x + 2)$, which is **always defined**.

Setting $g' = 0$ gives $x = -2, 0, 3$ as the critical points. Our g' chart is then

x	$(-\infty, -2)$	$(-2, 0)$	$(0, 3)$	$(3, \infty)$
$g'(x)$	+	-	-	+
$g(x)$	↗	↘	↘	↗

Thus, by the First Derivative Test, g has a

local maximum at $x = -2$, a local minimum at $x = 3$, and neither at $x = 0$

4. **(25 points)** A rectangular poster is to contain 50 in^2 of printed matter with margins of 4 inches at each of the top and bottom, and margins of 2 inches on each side. What are the height and width of the poster fitting those requirements that has the smallest possible area?

Solution. Here's the diagram:

The printed matter inside the poster is a rectangle; call this smaller rectangle's width x and its height y . Taking the margins into account, the full poster has width $x + 4$ and height $y + 8$.

So the printed area is $50 = xy$, which means $y = 50/x$.

Meanwhile, the full poster has area $(x + 4)(y + 8) = (x + 4)(50/x + 8) = 8x + 82 + 200/x$.

We have $x > 0$ and $y > 0$, which gives just $x > 0$. [Note that $x = 0$ is impossible to get $xy = 50$. And $y > 0$ gives only $50/x > 0$, which is the same as $x > 0$.]

So we must minimize $f(x) = 8x + 82 + 200x^{-1}$ on $(0, \infty)$.

We compute $f'(x) = 8 - 200x^{-2}$, which is always defined on the original domain.

Setting $f'(x) = 0$ gives $8x^2 = 200$, so $x^2 = 25$, and so $x = \pm 5$; but $-5 \notin (0, \infty)$, meaning that the only critical point is $x = 5$. Our f' chart is:

x	$(0, 5)$	$(5, \infty)$
$f'(x)$	-	+
$f(x)$	↘	↗

So by FDTAE, f has an absolute minimum at $x = 5$ in. That gives $y = 50/5 = 10$ in.

So the best poster therefore has width $x + 4 = 9$ in, and height $y + 8 = 18$ in.

That is, the best poster is 9 in wide by 18 in high

5. **(10 points)** Here are some values of a certain continuous function $h(x)$:

x	-4	-3	-2	-1	0	1	2	3	4	5	6
$h(x)$	3	1	0	-1	-2	-2	0	1	5	8	7

Estimate $\int_{-3}^5 h(x) dx$ using **four** approximating rectangles of equal width and **right** endpoints. That is, compute R_4 .

Solution. Cutting the interval $[-3, 5]$ into four equal intervals means each interval has width $\Delta x = (5 - (-3))/4 = 8/4 = 2$. Thus, the right endpoint Riemann sum for four intervals is $R_4 = 2 \cdot [f(-1) + f(1) + f(3) + f(5)] = 2(-1 - 2 + 1 + 8) = 2 \cdot 6 = \boxed{12}$

6. (15 points) Compute the following definite and indefinite integrals.

(a) $\int (5 \sec t + 7 \tan t) \sec t \, dt$

(b) $\int_{-1}^2 x^3(x+3)^2 \, dx$

Solution. (a) $\int (5 \sec t + 7 \tan t) \sec t \, dt = \int 5 \sec^2 t + 7 \sec t \tan t \, dt = \boxed{5 \tan t + 7 \sec t + C}$

(b) $\int_{-1}^2 x^3(x+3)^2 \, dx = \int_{-1}^2 x^3(x^2 + 6x + 9) \, dx = \int_{-1}^2 x^5 + 6x^4 + 9x^3 \, dx = \frac{1}{6}x^6 + \frac{6}{5}x^5 + \frac{9}{4}x^4 \Big|_{-1}^2$
 $= \left(\frac{1}{6}(64) + \frac{6}{5}(32) + \frac{9}{4}(16) \right) - \left(\frac{1}{6} - \frac{6}{5} + \frac{9}{4} \right) = \frac{63}{6} + \frac{6 \cdot 32}{5} + \frac{9 \cdot 15}{4}$

[And you can just stop there. But for the record, that is:]

$$= \frac{21}{2} + \frac{192}{5} + \frac{135}{4} = \frac{210 + 792 + 675}{20} = \boxed{\frac{1677}{20}}$$
